Preface

This year's edition of International Debt Statistics, successor to Global Development Finance and World Debt Tables, and the third in the series, is designed to respond to user demand for timely, comprehensive data on trends in external debt in developing countries. It also provides summary information on the external debt of high-income countries and public (domestic and external) debt for a select group of countries.

The World Bank's Debtor Reporting System (DRS), from which the aggregate and country tables presented in this report are drawn, was established in 1951. World Debt Tables, the first publication that included DRS external debt data, appeared in 1973 and gained increased attention during the debt crisis of the 1980s. Since then, the publication and data have undergone numerous revisions and iterations to address the challenges and demands posed by the global economic conditions.

Presentation and access to data have been refined to improve the user experience. The printed edition of *International Debt Statistics 2015* now provides a summary overview and a select set of

indicators, while an expanded dataset is available online (datatopics.worldbank.org/debt/ids).

By providing comprehensive and timely data that reflects the latest additions and revisions, and by expanding the scope of the data available online, we aim to serve the needs of our users and to reach a wider audience. Improvements in data dissemination are matched with ongoing efforts to improve the quality and timeliness of data collection. In partnership with the major providers of debt data management systems to developing countries, the Commonwealth Secretariat (COMSEC) and the United Nations Conference on Trade and Development (UNCTAD), we are working toward an established standard code and a set of system links that will enable countries to provide their DRS reports electronically in a seamless and automated data exchange process.

As these changes take place, we welcome your feedback and suggestions for further improvements at data@worldbank.org.

Haishan Fu Director, Development Data Group

Acknowledgments

This volume was prepared by the Financial Data Team of the Development Data Group (DECDG), led by Ibrahim Levent under the management of Neil Fantom, and comprising Peter Bourke, Wendy Huang, Malvina Pollock, Evis Rucaj, Rubena Sukaj, Sun Hwa Song, Rasiel Vellos, Alagiriswamy Venkatesan, and Molly Watts, who worked closely with other teams in DECDG. The team was assisted by Elysee Kiti. The overview of current developments was prepared by Malvina Pollock, Evis Rucaj, and Rasiel Vellos in consultation with the staff of DECDG; country economists reviewed the data tables. The work was carried out under the direction of Haishan Fu. Valuable advice was provided

by the Operations and Strategy unit of the Vice Presidency.

The production of this volume was managed by Azita Amjadi. The online database was prepared by Shelley Fu and William Prince. International Debt Statistics electronic products were prepared by a team led by Malarvizhi Veerappan under the supervision of Soong Sup Lee and comprising Rajesh Danda, Jean-Pierre Djomalieu, Ramgopal Erabelly, Shelley Fu, Gytis Kanchas, Ugendran Machakkalai, Nacer Megherbi, and Manish Rathore. The cover was designed by Jomo Tariku. Susan Graham, Andrés Meneses, and Paola Scalabrin from the Publishing and Knowledge Division of the World Bank coordinated the publication and dissemination of the book.

User Guide to Tables

International Debt Statistics 2015 focuses on financial flows, trends in external debt, and other major financial indicators for developing and advanced economies. The report includes more than 200 time series indicators from 1970 to 2013 for most reporting countries. This edition of International Debt Statistics (IDS) has been reconfigured to offer a more condensed presentation of the principal indicators, along with additional tables showcasing Quarterly External Debt Statistics and Public Sector Debt.

Tables

Aggregate Tables

The aggregate tables are labeled by region name. Data are shown for all developing countries and six regional groups (East Asia and Pacific, Europe and Central Asia, Latin America and the Caribbean, Middle East and North Africa, South Asia, and Sub-Saharan Africa).

Country Tables

Country tables are labeled by country name and ordered alphabetically. Data are shown for 124 developing countries that report public and publicly guaranteed external debt to the World Bank's Debtor Reporting System (DRS). The tables also include key debt ratios and the composition of external debt stocks and flows for each country.

Each table shows a time series with the most recent six years, as well as 2000 and 2005 as companion years. Full time series data are available for all countries in the World Bank's Open Data website (http://data.worldbank.org/data-catalog/international-debt-statistics).

Statistics

The general cutoff date for countries to report data for this publication was end-September 2014. The economic aggregates presented in the tables are prepared for the convenience of users. Although debt ratios can give useful information about developments in a debt-servicing capacity, conclusions drawn from them will not be valid unless accompanied by careful economic evaluation.

The macroeconomic data provided are collected from national statistical organizations, which in some cases may be subject to a considerable margin of error. The usual care must be taken in interpreting the ratios, particularly for the most recent years, because figures may be preliminary and subject to revision.

Notes at the bottom of each country table summarize major events that have taken place in the country in recent years; describe the sources of information for short-term and private non-guaranteed external debt if the reports were not provided by the country; and highlight main issues in the data collection process. Unless otherwise specified, data on long-term public and publicly guaranteed external debt for 2013 are based on reports provided by the country.

More detailed information on data sources, methodology, and compilation is provided in the appendix at the back of this book.

Aggregate Measures for Income Groups and Regions

Aggregate measures for income groups and regions include the 124 developing countries that report public and publicly guaranteed external debt to the World Bank's DRS, whenever data are available. The aggregate "All developing countries" is the sum of data for 124 countries.

Classification of Economies

For operational and analytical purposes, the World Bank's main criterion for classifying economies is gross national income (GNI) per capita (calculated by the World Bank Atlas method). Every economy is classified as low income, middle income, or high income. Low- and middle-income countries are sometimes referred to as developing countries. The term is used for convenience; it is not intended to imply that all countries in the group are experiencing similar development or that other economies have reached a preferred or final stage of development. Because GNI per capita changes over time, the country composition of income groups may change from one edition of International Debt Statistics to the next. Once

the classification is fixed for an edition, based on GNI per capita in the most recent year for which data are available, all historical data presented are based on the same country grouping.

Symbols

- 0 or 0.0 means zero or small enough that the number would round to zero at the displayed number of decimal places.
- .. means that data are not available or that aggregates cannot be calculated because of missing data in the years shown.
- \$ indicates current U.S. dollars unless otherwise specified.

User Guide to IDS Online Tables

The extended version of country tables that were previously available in the *International Debt Statistics* print edition is now available online. Using an automated query process, these reference tables will be updated based on the revisions to the International Debt Statistics database.

Users can access all the online tables, download the PDF version of the publication, view the report as an eBook on ISSUU, as well as access the database and download the archived editions of the publication by going to http://data.worldbank.org/products/ids.

How to Access IDS Online Country Tables

To access the IDS online tables, visit http://datatopics.worldbank.org/debt/ids and select from "Country," "Region," or "Topic" options.

Data 2015 International Debt Statistics COUNTRY Data are shown for developing countries that report public and publicly guaranteed external debt to the World Bank's Debtor Reporting System (DRS). The tables also include key debt ratios and the composition of external debt stocks and flows for REGION each country. TOPIC Afghanistan Albania Algeria Angola Argentina Armenia Azerbaijan Bangladesh Belarus Belize Benin Bhutan Bosnia and Herzegovina Botswana Bulgaria Burkina Faso Cambodia Burundi Cameroon Cape Verde Central African Republic Chad China Colombia Comoros Congo, Dem. Rep. Congo, Rep. Costa Rica Cote d'Ivoire Djibouti Dominica Dominican Republic Ecuador Egypt, Arab Rep. Fiji El Salvador Eritrea Ethiopia Gabon Gambia, The Georgia Ghana Grenada Guatemala Guinea Guinea-Bissau Haiti Guyana Honduras Hungary

To access a specific country table directly without going through the above landing page, use the URL http://datatopics.worldbank.org/debt/ids/ and the country name (for example, http://datatopics.worldbank.org/debt/ids/country/argentina to view the table for Argentina). Similarly, to view the regional table, click on the "Region" tab and select one of the listed regions (for example http://datatopics.worldbank.org/debt/ids/region/south-asia to view the table for South Asia).

Indicators

The indicator codes for each of the indicators online and in the publication are listed below. To view a specific indicator online, go to http://data.worldbank.org/indicator/ and add the indicator code at the end of the url; for example, to view a page for total debt stocks, this line should be in your browser:

http://data.worldbank.org/indicator/DT.DOD.DECT.CD

How to Use the Databank

DataBank (http://databank.worldbank.org) is an online web resource that provides simple and quick access to collections of time series data. It has advanced functions for selecting and displaying data, performing customized queries, downloading data, and creating charts and maps. Users can create dynamic, custom reports based on their selection of countries, indicators, and years. All these reports can be easily edited, shared, and embedded as widgets on websites or blogs. For more information, see http://databank.worldbank.org/help.

PART I

Introduction

International Debt Statistics 2015 presents data and analysis on the external debt of developing countries for 2013, based on actual flows and debt-related transactions reported to the World Bank Debtor Reporting System (DRS) by 124 developing countries. International Debt Statistics 2015 provides users with comprehensive stock and flow data on the external debt of individual developing countries and for regional and analytical groupings and data on aggregate net capital flows (debt and equity) in 2013. In addition, International Debt Statistics (IDS) showcases other debt data collected and compiled by the World Bank. These include the high frequency, quarterly data for high-income and developing countries reported to the joint World Bank—International Monetary Fund (IMF) Quarterly External Debt Statistics (QEDS) and to the Public Sector Debt (PSD) initiatives. The main messages from the 2013 data are:

- 1. Net debt flows to developing countries increased to \$542 billion in 2013, an increase of 28 percent over the comparable figure for 2012. However, the aggregates are heavily impacted by the rise in net debt flows to China, which jumped to \$139 billion, four times their 2012 level. Net debt flows to developing countries, excluding China, were \$403 billion, only 3 percent higher than in 2012.
- 2. Long-term debt flows from private creditors rose 24 percent in 2013, to \$337 billion, because of an increase in medium-term bank financing and another record year for bond issuance.
- 3. Net equity inflows, at \$643 billion, changed little from 2012. Foreign direct investment proved resilient, rising 6 percent in 2013, but gains were offset by a 29 percent fall in portfolio equity flows. Aggregate net financial flows totaled \$1,184 billion, 10 percent higher than 2012, and were considered stable when measured relative to developing countries' gross national income (GNI) at 6 percent.
- 4. External debt burdens in developing countries remained moderate. The ratio of external debt to GNI averaged 23 percent in 2013, and the ratio of external debt to exports averaged 79 percent. International reserves stood at 111 percent of external debt stocks.
- 5. Countries reporting to the QEDS confirm that external debt levels in high-income countries are, on average, much higher than in developing countries, but they have moderated somewhat in 2013.

DEBTOR REPORTING SYSTEM

Trends in Debt Stocks and Flows, 2013

Debt stocks accumulated by 10 percent in 2013

Figure O.1 External Debt Stock of Developing Countries, 2008–13

Source: World Bank Debtor Reporting System.

The total debt outstanding to developing countries rose 10 percent in 2013, a similar rate of accumulation to 2012. The combined stock of external debt of developing countries rose from \$5 trillion in 2012 to \$5.5 trillion at the end of 2013. This reflects net debt inflows of \$542 billion, debt forgiveness, and the effect of year-on-year exchange adjustments between local currencies and the U.S. dollar (approximately one-third of developing countries' debt is denominated in U.S. dollars). Short-term debt stocks rose 14 percent, compared with a 9 percent rise in long-term debt, and accounted for 28 percent of the total outstanding external debt at the end of 2013—up from 26 percent the previous year. Private nonguaranteed debt stocks increased by 11 percent, twice the rate of public and publicly guaranteed debt. The stock of long-term debt at end-2013 was almost evenly divided between publicly guaranteed debt and debt owed to private nonguaranteed borrowers.

Net debt flows surged to a record high

Figure O.2 Net Debt Flows to Developing Countries, 2008–13

Source: World Bank Debtor Reporting System.

Net debt flows rose to a record high of \$542 billion in 2013, 28 percent higher than the comparable figure for 2012. This was driven by a 50 percent increase in net short-term debt flows and a 24 percent rise in long-term debt inflows from private creditors. In contrast, net debt inflows from official creditors fell 32 percent, primarily as a consequence of large repurchases (repayments) by developing countries to the IMF: \$24 billion, up 83 percent from their 2012 level. Net debt inflows from other official bilateral and multilateral creditors held steady at \$43 billion. Private creditors remained dominant and accounted for 97 percent of net debt flows in 2013. Long-term debt flows from private creditors continued their upward trajectory, rising in 2013 to \$337 billion on the back of an increase in medium-term bank financing and another record year for bond issuance by developing country borrowers. The share of short-term debt in total net inflows from private creditors rose to just over one-third in 2013, from approximately 31 percent in 2012.

External debt burdens remain moderate

Figure O.3 Key Debt Indicator Trends in Developing Countries, 2000–13

Sources: World Bank Debtor Reporting System and International Monetary Fund.

The majority of developing countries have seen their economies rebound strongly since 2010 with a concomitant improvement in the ratio of outstanding external debt to GNI and to export earnings: an average of 23 percent of GNI and 79 percent of export earnings at end-2013. Risks associated with short-term debt (28 percent of external debt stocks at end-2013) were mitigated by international reserves, which were at 111 percent of external debt stocks for the same period. Short-term debt is primarily trade related; when measured against developing countries' imports, it was at 21 percent, up only slightly from 2012. Developing countries have also seen significant improvement in their external debt payment servicing capacity over the past decade; a consequence of increased export earnings, debt restructuring, and outright debt relief from official and private creditors, and more recently, attractive borrowing terms in international capital markets. The debt service-to-export ratio averaged 10.5 percent in 2013, a marginal increase over the 10 percent recorded in 2012, but, more importantly, it was below half the 21.1 percent at the start of the decade.

Aggregate Financial Flows to Developing Countries, 2013

Net financial flows rise 10 percent in 2013 propelled by net debt inflows

International financial flows, debt and equity combined, totaled \$1,184 billion in 2013, 11 percent higher than 2012. The increase was driven by the 28 percent rise in net debt flows. Net equity flows held steady at \$643 billion, much the same level as 2012, with the 6 percent increase in foreign direct investment offset by the corresponding 29 percent decline in portfolio equity flows. The global trend was dominated by China, which accounted for more than one-third of net financial flows to developing countries in 2013, and where net financial flows rose by 45 percent compared with their level in the previous year. In contrast, other developing countries saw aggregate net financial flows contract by 2 percent in 2013, with net equity flows down 8 percent from their 2012 level. Although net debt flows to developing countries, excluding China, rose by 3 percent, there was a 22 percent contraction in short-term debt flows.

Figure 0.4 Net Financial Flows to Developing Countries, Debt and Equity, 2008–13

Sources: World Bank Debtor Reporting System, International Monetary Fund, and Bank for International Settlements.

Foreign direct investment accounts for around half of net financial flows - but the picture is mixed

Foreign direct investment proved resilient, accounting for approximately half of net financial inflows in 2013. UNCTAD's *World Investment Report* 2014¹ finds that developing countries were the destination for half of global foreign direct investment in 2013. Investors continue to be attracted by improved business and regulatory environments, growth prospects, and buoyant and expanding domestic markets. Net inflows to all developing countries combined rose 6 percent in 2013, to \$574 billion, and close to half of those inflows were directed at China. At the regional and country level, the picture was mixed. Among the top six recipients of net inflows, only Brazil recorded a downturn, and those to Colombia were static. In contrast, Mexico saw net inflows grow 159 percent, to \$31 billion, following the \$18 billion purchase of Grupo Modele by AB InBev, Belgium. Countries in Europe and Central Asia recorded the sharpest contraction in 2013 (19 percent), while those in South Asia saw the largest (16 percent) increase.

Figure 0.5 Net Foreign Direct Investment Inflows to Major Recipients, 2012 and 2013

Source: International Monetary Fund.

Portfolio equity flows remain strong but highly concentrated in a small number of countries

The volatility that characterized portfolio equity flows in recent years moderated somewhat in 2013. Although, in aggregate, these flows fell nearly 30 percent from their 2012 level, there had been a sharp drop in 2011 and then a steep rise in 2012 when investors sought emerging markets where growth prospects appeared strong and returns high. This trend broadly continued in 2013, but as always, portfolio equity flows were susceptible to political and economic uncertainty, exemplified by the sharp outflows from Thailand (\$6.5 billion) in 2013. Those to Nigeria were also down sharply, although they held up better than expected, given turmoil in the oil sector. Portfolio equity flows benefit only a handful of developing countries and, as with foreign direct investment, China was the destination of choice for half of such inflows in 2013.

Highlights

All Developing Countries

China inflows dominate the global trend in 2013

Figure O.7 Net Debt Flows for Select Country Groups, 2012 and 2013

China, the single largest borrower among developing countries, saw net debt flows grow 300 percent in 2013, largely because of a rise in short-term debt inflows, to \$115 billion (\$33 billion in 2012), with a near ninefold increase in long-term debt inflows from private creditors. These flows dominated the global trend in 2013 and masked disparate changes in the direction of net debt flows for other developing countries. Collectively, there was only a 3 percent rise in net debt flows in 2013 with a 14 percent increase in long-term debt inflows offset by the sharp (22 percent) contraction in short-term debt flows. Major borrowers fared somewhat better with the top ten borrowers, measured on the basis of external debt outstanding at end-2013, recording a 23 percent rise in net debt flows. However, when China is excluded, debt flows to this group reveal a drop of 6 percent.

Source: World Bank Debtor Reporting System.

Net inflows to IDA-only countries increase and diversify

Figure O.8 IDA-only Countries Net Debt Inflows by Creditor Type, 2013

The rise in net financial flows to developing countries is reflected in those directed to 54 countries eligible only for International Development Association (IDA) financing². In 2013, net financial flows to this group rose 21 percent, almost double the 11 percent increase in comparable flows recorded by other developing countries. Net capital inflows in 2013 totaled \$56 billion, about one-half of which were accounted for by debt flows. Debt flows have increased by 40 percent over the past three years, and have become increasingly diversified with private creditors now accounting for 33 percent of long-term debt inflows. While most IDA-only countries continue to remain heavily dependent on official, concessional sources of financing, a number have gained market access and issued bonds in international capital markets. Bilateral lenders are the most important category of creditors but IDA remained the single largest creditor to the group, accounting for almost 20 percent of net long-term debt inflows in 2013.

Source: World Bank Debtor Reporting System.

Private sector external borrowing accounts for the greatest share of net debt flows

Figure O.9 Composition of Net External Debt Flows by Type of Borrower, 2008–13

Source: World Bank Debtor Reporting System.

The important economic role played by the private sector in developing countries has led to a significant shift in borrowing patterns in recent years and in the composition of external debt stocks and flows. In 2009, in the wake of the global economic crisis, the nonguaranteed external obligations of private sector borrowers to developing countries accounted for only 31 percent of total long-term external debt stocks. At the end of 2013, their share had increased to more than 55 percent. At the same time, there has been an evolution in the composition of these flows, with bond issuance by private sector entities, an increasingly important component of medium-term debt inflows of private nonguaranteed debt, averaging more than 45 percent in the last four years. Although private-sector borrowing is driven by entities in more advanced emerging market countries, all regions have seen private nonguaranteed debt increase as a share of total external debt.

^{2.} There are 59 countries designated as IDA-only, as of July 1, 2014, of which 54 countries report to the DRS (see page 164).

Bond issuance continues apace

Bond issuance by public and private entities in developing countries reached a record \$233 billion in 2013, excluding the \$11 billion mega-bond issue by Petrobras, Brazil³. In 2012, the larger share of bond issuance was by public borrowers, but in 2013, it was private-sector borrowers that were dominant. Their total issuance rose almost 50 percent, to \$123 billion, equivalent to 52 percent of total developing country bond issuance in 2013. Corporate borrowers in Latin America and the Caribbean issued \$60 billion in 2013, almost one-half of all issuance by corporate borrowers; two-thirds of the amount was attributable to banks and private companies in Mexico, which issued \$43 billion in 2013. Bonds issued by public sector borrowers fell 22 percent in 2013, again driven by the Latin American and Caribbean region, which saw a decline of 35 percent.

Figure 0.10 Bond Issuance by Public and Private Sector Borrowers, 2012 and 2013

Source: World Bank Debtor Reporting System.

Inflows from bilateral creditors keep official flows steady

Net debt inflows from official creditors were broadly unchanged in 2013, at \$43 billion, excluding the IMF, and divided almost evenly between bilateral and multilateral creditors. However, the evolving trend in recent years shows net inflows from bilateral creditors to be on a strong upward trajectory. This continued in 2013 with net inflows rising nearly 80 percent, to \$21 billion, triple their 2011 level. In contrast, net inflows from multilateral creditors fell 25 percent in 2013, with a marked downturn in net inflows from a number of regional development banks. The driving force behind the increased bilateral flows is the lending from one developing country to another. Sub-Saharan Africa accounted for almost 40 percent of net inflows from bilateral creditors in 2013, followed by Middle East and North Africa, at 23 percent, primarily from creditors within the region, notably Kuwait, Saudi Arabia, and the United Arab Emirates.

Figure O.11 Bilateral and Multilateral Net Debt Flows, 2007–13

Source: World Bank Debtor Reporting System.

IBRD and IDA dominate inflows from multilateral creditors

Financing from the World Bank (IBRD and IDA) is the most important source of multilateral financing to developing countries. In 2013, net debt flows from the World Bank rose to \$15 billion, more than double the comparable figure for 2011 and equivalent to 67 percent of net inflows from all multilateral institutions, excluding the IMF. While disbursements from most multilateral institutions stagnated or declined in 2013, IBRD and IDA rose 12 percent, to \$17 billion, and 26 percent, to \$10 billion, respectively. IDA resources are reserved for the world's poorest countries, many located in Sub-Saharan Africa, which was the destination for more than half of IDA disbursements in 2013. IDA also provided almost 40 percent of multilateral disbursements to South Asia. Disbursements from IBRD were concentrated in creditworthy countries in Latin America and the Caribbean, East Asia and Pacific, and Europe and Central Asia, and accounted for 34 percent, 41 percent, and 34 percent, respectively, of total multilateral disbursements in each region, in 2013.

Figure O.12 Net Multilateral Disbursements from IBRD and IDA, Regional Distribution, 2013

Source: World Bank Debtor Reporting System.

^{3.} The bonds were issued through Petrobras' Dutch finance subsidiary Petrobras Global Finance PV and are considered to be non-resident, albeit 100 percent guaranteed by Petrobras, and not included in Brazil's external debt stocks or flows.

East Asia and Pacific

China drives net financial flows in the region

Figure O.13 Net Capital Flows to East Asia and Pacific Countries, 2007–13

Source: World Bank Debtor Reporting System.

In 2013, net financial flows to the region rose 15 percent, to \$563 billion, equivalent to 5 percent of the region's gross national income (GNI), primarily because of the 30 percent increase in net debt flows. Net equity flows rose moderately and were up only 7 percent over their 2012 level. The trend was dominated by China, which accounted for close to 80 percent of all inflows to the region and 52 percent of the combined external debt stock at the end of 2013. China saw net financial flows rise by 45 percent in 2013, to \$444 million, of which 69 percent was in the form of equity, and 31 percent constituted net debt flows. In stark contrast, other countries in the region saw net financial flows plummet by 36 percent in 2013, to \$119 billion, with net debt flows down by 44 percent, and net equity 18 percent below the 2012 level.

Most countries in the region saw a significant drop in net debt inflows in 2013

Figure 0.14 Net Debt Flow To East Asia And Pacific Countries, 2007–13

Source: World Bank Debtor Reporting System.

Net debt inflows to the region rose 30 percent in 2013, to \$210 billion (\$162 billion in 2012), driven by a 300 percent jump in those to China, which accounted for 66 percent of net debt flows to the region in 2013. For other major borrowers, Indonesia, Malaysia, and Thailand, it was a very divergent trend, and all three countries recorded a significant decrease in net debt flows in 2013 compared with the previous year. In Thailand, which had the biggest rise (414 percent) in debt inflows to the region from 2011 to 2012, net debt inflows fell 61 percent in 2013; those to Malaysia were only half their 2012 level; and Indonesia recorded a more modest fall at 16 percent. In all three countries, the decline was attributable to a fall in lending by private creditors and a contraction in short-term debt flows. For smaller borrowers, debt inflows were on an upward trajectory, rising 44 percent in Vietnam, 51 percent in the Solomon Islands, and 223 percent in Lao People's Democratic Republic.

Countries in the region account for twenty four percent of bond issuance by developing countries

Figure 0.15 Percent Share Bond Issuance in East Asia And Pacific by Country, 2013

Source: World Bank Debtor Reporting System.

East Asia and Pacific remained the second highest region in terms of bond issuance in 2013, with a 24 percent share among all developing countries. Drops in bond issuance by Thailand and Malaysia were offset by China, which almost tripled its bond issuance from 2012 to 2013, 82 percent of which was issued by corporate borrowers. Lao PDR came to the market for the first time in 2013, with a 3-year unrated \$50 million equivalent baht-denominated note; this is the first Thai baht issuance by a foreign government after the Thai authorities removed restrictions on the requirement that foreign issuers have an investment grade rating. Vietnam issued two bonds in 2013, one by Vingroup (ex-Vincom) for a \$200 million 4.5-year senior high-yield note and another government guaranteed 12-year note for \$626.8 million.

Europe and Central Asia

Sharp increase in 2013 net debt flows

Net financial flows to the region rose 35 percent in 2013, to \$139 billion (\$103 billion in 2012), as a consequence of a sharp increase in net debt flows. These net debt flows rose 120 percent over their 2012 level, to \$95 billion, and served to offset the 26 percent downturn in net equity flows. Foreign direct investment fell by 19 percent, to \$42 billion, and portfolio equity flows dropped to one-quarter of its 2012 level, largely because of the collapse in portfolio equity flows to Turkey. The increase in debt flows were underpinned by a near fivefold rise in long-term borrowing by private nonguaranteed entities, to \$58 billion, and a comparable increase in short-term debt inflows to \$33 billion. Financing from official creditors was negative, with outflows to the IMF climbing to \$23 billion (\$13 billion in 2012), reflecting repayment of rescue packages extended in the wake of the 2008 global economic crisis; these repayments primarily came from Hungary (\$6.7 billion), Romania (\$6.2 billion), and Ukraine (\$5.6 billion).

Figure 0.16 Net Capital Flows to Europe and Central Asia, 2010–13

Source: World Bank Debtor Reporting System.

Private sector borrowing has accelerated sharply over the past three years

The financial crisis that began in the last quarter of 2008 made cross-border borrowing from the private sector a lot more costly in 2009, which caused the official creditors, mainly the multilateral organizations, to lend money to the public sector. The net inflows from official creditors doubled in 2009, reaching \$49 billion (from \$2.5 billion in 2008), while the private creditors' medium- and long-term net inflows went down to \$7.7 billion, from \$130 billion in 2008. After 4 years, the situation has reversed. Europe and Central Asia's net medium- and long-term borrowing from foreign private creditors has rapidly increased since 2011, reaching its highest level in 2013 (from -\$11.5 billion in 2010 to \$80.7 billion in 2013). More than half of those net flows came from borrowing by the commercial banks and other sectors, while the official creditors recorded an outflow of \$19 billion. Hungary, Kazakhstan, and Turkey received 81 percent of those net inflows.

Figure O.17 Europe and Central Asia: Net Medium and Long-Term Debt Inflows by Type of Creditor, 2009–13

Source: World Bank Debtor Reporting System.

Equity inflows decline but the picture across the region is mixed

The share of equity in net financial flows to the region fell significantly in 2013, to 32 percent, compared with almost 60 percent the previous year. Equity flows to the region are heavily concentrated in five countries: Azerbaijan, Kazakhstan, Turkey, Turkmenistan, and Ukraine, which together account for more than 65 percent of foreign direct investment and 95 percent of portfolio equity flows to the region. When the top five recipients are excluded, inflows of foreign direct investment to the region fell by 21 percent in 2013, although some of the smaller economies, notably Albania, Belarus, Bulgaria, and Romania showed growth. Foreign direct investment inflows to these countries increased between 41 percent (Belarus) to as much as 146 percent (Romania, to \$2.5 billion). Net foreign direct investment to Albania, at \$1.3 billion, reached its highest level ever and was up 1.9 times over the 2012 level. The majority of these flows constituted reinvestment, targeted mainly at the extractive and processing industries.

Figure O.18 Foreign Direct Investment Equity inflows, 2012 and 2013

Source: World Bank Debtor Reporting System.

Latin America and the Caribbean

Composition of external debt shift in 2013

Figure O.19 Composition of Net Debt Inflows, 2012 and 2013

Source: World Bank Debtor Reporting System.

Net debt inflows to the region rose 10 percent in 2013, to \$149 billion (\$136 billion in 2012), accompanied by some changes in composition. Mediumand long-term net inflows from banks increased, rising by 127 percent over their 2012 level, to \$58 billion, offsetting a 17 percent fall in net inflows from bond issuance by public and private entities and a 9 percent contraction in short-term debt inflows. Official creditors account for only a modest share of net debt flows, but these too fell by one-third in 2013, to \$8.2 billion. In aggregate, net equity flows held steady with the collapse in portfolio equity flows to Mexico, offset by a doubling of those to Brazil, at \$11.6 billion (\$5.6 billion in 2012). The 20 percent fall in foreign direct investment to Brazil more than compensated for the tripling of comparable flows into Mexico. Taken together, Brazil and Mexico increased their share of net equity flows to the region to 61 percent (58 percent in 2012).

Equity and private sector borrowing drive financial flows to Mexico

Figure O.20 Mexico: Debt and FDI inflows, 2007-13

Source: World Bank Debtor Reporting System.

Net financial flows to Mexico totaled \$109 billion in 2013, on par with 2012 and equivalent to 38 percent of the comparable flows to countries in Latin America and the Caribbean combined. In contrast to 2012, when net debt flows to public sector borrowers was the most important component of financial flows, 2013 saw high levels of foreign direct investment and debt flows to private sector borrowers. Together they rose 104.2 percent, to \$73 billion, more than enough to offset the 42 percent drop in flows to public sector borrowers and a sharp contraction in short-term debt and portfolio equity flows. Foreign direct investment rose by 159 percent, to \$31 billion, which made Mexico the third largest developing country recipient in 2013. Net debt inflows to private nonguaranteed borrowers, which have been on a rising trajectory since 2010, jumped by 77 percent in 2013, to \$42 billion, equivalent to more than half the total net debt inflows in 2013.

Equity constitutes a significant share of net financial flows

Figure O.21 Net Financial Flows: Share of Debt and Equity, 2013

Source: World Bank Debtor Reporting System.

Net financial flows to the region averaged \$280 billion per annum in 2012 and 2013, divided roughly equally between debt and equity. Brazil and Mexico combined accounted for 72 percent of these flows in 2013, with inflows to each country at a broadly similar level: \$96 billion for Brazil and \$109 billion for Mexico. There was, however, a marked difference in the composition flows to each country. In Brazil, the second most important developing country destination after China, equity inflows comprised 55 percent of total inflows in 2013, whereas in Mexico, their share was only 27 percent. For other countries in the region, equity was by far the most important source of financing and made up 67 percent of net financial flows during 2013. This is partially explained by large net debt outflows from República Bolivariana de Venezuela, but it also reflects robust foreign investment across the region, attracted by natural resources, a fast expanding middle class, inter-regional investments, and mega infrastructure projects such as the Panama Canal Expansion Project.

Middle East and North Africa

Net financial flows rise due to increase in debt flows

Net financial flows to the region were up 35 percent, to \$31 billion in 2013, entirely because of increased net debt inflows, which rose to \$16.7 billion, close to double their 2012 level. Net equity inflows, on which the region has been historically more reliant than debt, were at \$14.3 billion—virtually unchanged from their 2012 level, although there were some important shifts in country composition. Foreign direct investment inflows to the Islamic Republic of Iran, the region's primary recipient, fell by one-third in 2013, to \$3 billion, while those to Morocco rose by 34 percent, to \$3.2 billion. The principal drivers of increased debt flows were lending by official, notably bilateral, creditors; bond issuance by several countries; and, to a lesser degree, a turnaround in short-term debt flows that turned positive in 2013, at \$0.4 billion (from an outflow of \$1.8 billion in 2012). The combined external debt stock rose by 9 percent, to \$191 billion, of which 72 percent constituted public and publicly guaranteed debt.

Figure O.22 Net Financial Flows, 2007-13

Source: World Bank Debtor Reporting System.

Net debt inflows to the region rise sharply but are heavily concentrated

Long-term debt flows to the region increased over the past two years, to \$10.2 billion in 2012 (from an outflow in 2011), and then rose by 51 percent in 2013, to \$15.4 billion. In parallel, these flows have become increasingly concentrated in the Arab Republic of Egypt, Jordan, and Morocco. Their combined share jumped from 51 percent of long-term debt inflows in 2012 to 98 percent in 2013. The composition of debt flows to each country vary: for Egypt, two-thirds of the inflows in 2013 came from bilateral creditors, notably Kuwait, Saudi Arabia, and the United Arab Emirates, plus the IMF. In contrast, half the net debt flows to Morocco were from multilateral creditors, while the other half were from private creditors. In Jordan, more than one-third of net long-term debt inflows in 2013 reflected tranche release under the IMF Standby Arrangement, and the remainder came primarily through the issuance of U.S. dollar denominated Treasury Bonds and a \$1.25 billion 7-year Eurobond with a 100 percent guarantee by the U.S. government.

Figure 0.23 Net Debt Inflows by Country, 2011-13

Source: World Bank Debtor Reporting System.

Debt-to-export ratios are, on average, much lower than in other developing countries

The ratios of external debt stock to exports and to GNI for the region averaged 55 percent and 17 percent, respectively, at the end of 2013, up from 41 percent and 14 percent, respectively, in 2012; the increase is attributed to a rise in external debt stock and a contraction in growth and exports. However, debt ratios remain considerably lower than those for other developing countries: 79 percent to exports and 23 percent to GNI at the end of 2013. This level is largely due to the high share of equity in net financial flows in prior years and the robust exports during the past decade. The debt service-to-exports ratio, 5 percent in 2013, was also half that for other developing countries. International reserves were 152 percent of external debt stock at the end of 2013, but the regional aggregate is heavily influenced by Algeria's high level of reserves (\$194 billion) and its very low external debt stock (\$5 billion). In contrast, Egypt accounted for 23 percent of the region's external debt stock at the end of 2013, but its reserves were only 31 percent of outstanding external debt.

Figure O.24 Debt Ratios for Middle East and North Africa, 2012 and 2013

Source: World Bank Debtor Reporting System.

South Asia

Fall in net capital flows due to India

Figure 0.25 Net Capital Flows by Type, 2007-13

Source: World Bank Debtor Reporting System.

Net capital flows to the region fell 5 percent in 2013 because of a downturn in net debt flows. This downturn was the result of a sharp contraction in short-term debt flows, coupled with a net outflow of \$3 billion to holders of Indian bonds (from a \$4.5 billion inflow in 2012) and \$2.6 billion outflow to the IMF from Pakistan. Outflows were largely offset by a jump in long-term bank lending, directed almost entirely to a wide range of private sector entities in India; long-term bank lending rose to \$40 billion, 76 percent over its 2012 level. Net equity inflows at \$51 billion were broadly unchanged in aggregate with increased inflows of foreign direct investment offsetting a corresponding downturn in portfolio equity flows. The principle player was India, which accounted for 93 percent of aggregate net capital flows to the region in 2013.

Financial flows to the region rise by 39 percent, excluding India

Figure O.26 Financial Flows to South Asia, Excluding India, 2013

Source: World Bank Debtor Reporting System.

Net financial flows to countries in the South Asia region, excluding India, constitute a very small, 7 percent, share of the region's aggregate flows, but their financing patterns differ from the regional trend. In 2013, net financial flows to this group of countries rose by 39 percent, to \$6.3 billion, driven primarily by increased equity inflows. These equity inflows grew by 21 percent, to \$4.3 billion, due to increased foreign direct investment flows across the region; in particular, there was a strong showing by Bangladesh, and a sharp rise in Pakistan mainly because of the service (telecom) sector. Despite a \$0.7 billion outflow of short-term debt and \$2.6 billion net outflow to the IMF from Pakistan, net debt flows doubled to \$2.0 billion in 2013, and they accounted for 32 percent of net financial flows. Long-term debt flows were \$3.2 billion, little changed from 2012, but with a shift in composition of lending from official sources (\$2.5 billion to \$1.6 billion) to private sources (\$0.4 billion to \$1.6 billion).

Debt indicators vary widely across the region

Figure 0.27 Debt Ratios for South Asia, 2013

Source: World Bank Debtor Reporting System.

The ratio of external debt stock to GNI for the region, 23 percent, fell in 2013, and the ratio of external debt stock to exports remained virtually unchanged (97 percent) from 2012. These averages were determined by and closely correlated with India's debt ratios (23 percent to GNI and 89 percent to exports), given the weight of the Indian economy compared with that of its neighbors. Across the region, however, there was a wide disparity in ratios. The debt-to-export ratio ranged from highs of 215 percent and 185 percent for Bhutan and Pakistan, respectively, to a low of 88 percent in Bangladesh. Bhutan had the highest ratio of debt to GNI, 84 percent, compared with Bangladesh and Nepal, both at 20 percent. The ratio of international reserves to debt, 58 percent for the region as a whole, was also heavily weighted by India (65 percent), but the ratio varies widely from 138 percent for Nepal to as low as 9 percent for Pakistan.

Sub-Saharan Africa

Net debt inflows offset by net equity flows

Net capital flows to Sub-Saharan Africa stagnated in 2013 with increased net debt inflows offset by a fall in net equity flows, the latter largely because of a steep 44 percent drop in portfolio equity flows to Nigeria. On the debt front, net inflows of long-term debt were up 35 percent over their 2012 level, to \$29.5 billion, with official creditors registering close to a 40 percent rise and those from bond issuance tripling to \$9 billion. However, these were offset by the fall in medium-term financing from banks and the sharp contraction in short-term debt inflows, which fell to \$2.6 billion, around one-third their 2012 level. Overall, net debt flows were up by a moderate 7 percent in 2013. The picture changes radically, however, if South Africa is excluded from the aggregates. With that exclusion, net debt inflows to other countries in the region increased by 63 percent in 2013, to \$29 billion (\$17.7 billion in 2012). When measured in terms of GNI, net capital flows to the region (excluding South Africa) were 5.9 percent in 2013, down slightly from 2012.

Figure O.28 Net Capital Flows for Sub-Saharan Africa, 2007–13

Source: World Bank Debtor Reporting System.

Long- term debt is rising and its composition is changing

The rapid rise in external borrowing by countries in the region is characterized by a marked change in borrowing patterns and creditor composition. Disbursements of long-term debt, excluding South Africa, increased 51 percent in 2013, triple the comparable rise for other developing countries, to \$41 billion. Of this, one-half was accounted for by private creditors. Disbursements from private creditors have not only risen, they have also become more diversified. In 2010, all long-term private debt was attributable to banks and other private creditors, but by 2013 one-third was accounted for by bond issuance. Borrowing patterns have also changed, with two-thirds of disbursements from private creditors now directed to publicly guaranteed private-sector borrowers. Disbursements from official creditors have risen moderately, 35 percent since 2010, but they are also characterized by a change in composition. IDA remains the single largest creditor, but overall, multilateral creditors' share of official lending had fallen to 43 percent by 2013, with China the main driver for increased bilateral lending.

Figure O.29 Disbursements to Sub-Saharan Africa, Excluding South Africa, 2007–13

Source: World Bank Debtor Reporting System.

Bond issuance booms

Historically, bond issuance in Sub-Saharan Africa was largely confined to South Africa, but following Ghana's debut sovereign issue in 2007, bond issuance by countries in the region, including those that benefited from HIPC and MDRI debt relief, has become a rapidly rising phenomenon. Access to markets has been facilitated by benign global market conditions and the region's high return potential. Issuance of bonds to the region in 2013, excluding South Africa, totaled \$6.9 billion, equivalent to 35 percent of disbursements from official creditors and 19 percent of foreign direct investment inflows to the region. This \$6.9 billion included debut issues by Mozambique, Rwanda, and Tanzania. The primary purpose of governments' international sovereign bonds is infrastructure spending, benchmarking for other government and corporate bond markets (as in the case of Nigeria), and public debt management. For example, Rwanda issued a \$400 million, 10-year, 6.875 Eurobond in April 2013, which will finance the construction of a convention center and the repayment of some state-owned RwandAir debt.

QUARTERLY EXTERNAL DEBT STATISTICS

About the Data

In October 2014, the World Bank, in collaboration with the IMF, launched the new Quarterly External Debt Statistics (QEDS) database in line with the classifications and definitions of the 2013 External Debt Statistics: Guide for Compilers and Users (2013 EDS Guide and sixth edition of the Balance of Payments and International Investment Position Manual (BPM6). The QEDS database reflects new concepts and definitions, classifications of external debt data, as well as expanded coverage that enhances the analytical use of the data. The database brings together detailed external debt data of countries that subscribe to the IMF's Special Data Dissemination Standard (SDDS) and a select number of countries that participate in the IMF's General Data Dissemination System (GDDS). The benefit of bringing together comparable external debt data is to facilitate macroeconomic analysis and cross-country data comparison.

Trends in the External Debt of High-Income **Economies**

The external debt stock of high-income economies in 2013 was uneven. Compared with 2012, the debt stock varied from a decline of 23 percent in Finland, to the highest increase, 31 percent, in the Czech Republic. The shortterm debt stock remained high, at 41 percent of the total debt. The total external debt stock for high-income economies reporting to the QEDS database rose 2 percent in 2013, to \$68 trillion, while the external debt stock of developing countries in the SDDS database during the same time period increased by 1 percent (see Table O.1). The increase in high-income economies' external debt stock was partly driven by the rise in debt of general government, particularly for Cyprus, the Slovak Republic, Slovenia, and Spain. Contributing to the growth was also a moderate increase in external debt by the private sector with debt by "Other sectors" rising by 6 percent, and "Direct investment: intercompany Table 0.1 High-Income Economies, External Debt

Stock, 2012 and 2013

lending" by 8 percent. Issuance of bonds by high-income economies rose by 2 percent, to \$29.1 trillion, with Iceland and the Slovak Republic issuing the most.

During 2013, the external debt situation relative to GDP rose marginally for high-income economies to 142 percent. The three most heavily indebted countries were France, Greece, and Portugal, which had debt-to-GDP ratios above 200 percent⁴. On the other hand, the least indebted countries were the Republic of Korea, Israel, and the Russian Federation (each less than 40 percent). During 2013, the largest increase in debt-to-GDP ratio was experienced by the Czech Republic, the Slovak Republic, and Spain, while Finland, Germany, and New Zealand saw their debt-to-GDP ratio decline.

The Group of Seven (G7) countries⁵ accounted for 64 percent of the total external debt of high-income economies, totaling \$43.7 trillion, during 2013 (see table O.2). The G7 countries' debt stock maintained the 2012 levels, with a slight increase of 0.5 percent. The increase was led by the United States, for which the external debt stock rose by 5 percent in 2013, compared with only 1 percent the previous year. This was followed by Italy and France, which showed external debt stock increases of 4 percent and 3 percent, respectively. Conversely, Japan, Germany, and Canada recorded a reduction in their external debt stock by 7 percent, 5 percent, and 1 percent, respectively.

^{4.} Excludes countries with offshore liabilities.

^{5.} G7 = Group of Seven (Canada, France, Germany, Italy, Japan, the United Kingdom, and the United States).

Source: World Bank Quarterly External Debt Statistics.

Despite having recorded a large increase in its debt stock, the external debt-to-GDP ratio in the United States increased slightly to 98 percent. Japan's ratio of external debt-to-GDP ratio rose to 57 percent in 2013 from 51 percent in 2012. In Italy and Canada, the external debt level remained relatively unchanged. Among the G7 countries, Germany had the most significant improvement

in their ratio of external debt to GDP, which fell to 151 percent, from 169 percent in 2012. At 371 percent, the United Kingdom had the highest external debt-to-GDP ratio; nonetheless, for 2013 it shows a decline from the previous year. France's debt burden was still above 200 percent, but it recorded a slight improvement in its ratio from 2012 (see figure O.31).

PUBLIC SECTOR DEBT

About the Data

The government and public sector debt data have gained significant attention over the past four years. In 2010, as part of the Open Data Initiative, the World Bank, in partnership with the IMF, mandated by the Inter Agency Group (IAG), launched the online, quarterly, Public Sector Debt database in order to fill the gap between analytical needs and a lack of access to high quality, crosscountry data. A continued emphasis on public sector debt was voiced in the 'Communiqué of Meeting of G20 Finance Ministers and Central Bank Governors' on February 16th, 2013, which advocated for "strengthening the public sector balance sheet" and "transparency and comparability of public sector reporting, and monitoring the impact of financial sector vulnerabilities on public debt."

Since the last Task Force on Financial Statistics (TFFS) meeting in March of 2013, the Public Sector Debt Statistics database has experienced a moderate change in membership. Currently 38 developing countries and 35 highincome economies report their data to the Public Sector Debt database.

Trends in 2013

Government debt levels in EU15 economies continued their upward trends in 2013. Despite the programs of fiscal austerity and the new pacts on fiscal discipline, many of the EU15 economies failed to bring their debt down to a more sustainable level. The average government debt-to-GDP ratio rose to 90 percent (87 percent in 2012).

The Government of Greece still owes \$443 billion even after three years of strict austerity measures, tax policies, and debt cuts of 53 percent (100 billion euro in March 2012). Greece recorded a government debt of 176.3 percent of GDP, followed by Italy (132.6 percent), Portugal (125.2 percent), and Ireland (125.8 percent). Only 4 countries (Denmark, Finland, Luxembourg, and Sweden) recorded debt ratios below the 60 percent debt default.

High government debt levels were not restricted to EU15 economies only. Cyprus recorded a government debt of \$25.3 billion at the end of 2013, up from \$19.8 billion in 2012, which accounted for 110 percent of GDP at the end of 2013, compared with 84 percent at the end of 2012. This was the highest increase among all 28 EU members and was primarily the result of borrowing from the European Stability Mechanism in 2013 (see Figure O.32).

When looking at the countries of the Organisation for Economic Co-operation and Development (OECD) outside the Euro Zone, Japan's government debt-to-GDP ratio surpassed 200 percent in 2013, while the ratios of the United States and the United Kingdom stood at 94.5 percent and 85.5 percent, respectively. However, unlike the other two countries, 92 percent of the Japanese government debt has been financed by domestic creditors, recording the highest rate of the leading economies.

The developing economies accumulated less debt during the crisis. The government debt-to-GDP ratios for developing economies in 2013 were more promising than those of high-income economies. Based on the reports to the Public Sector Debt database, the government debt-to-GDP ratio in 2013 ranged from the lowest, 13 percent in Russia, to the highest, 82 percent in Hungary, which was, in most instances, lower than the comparable ratio for 2008. Big economies like Brazil and India saw government debt fall from 55 percent and 68 percent of GDP, respectively, in 2012, to 53 percent and 66.6 percent, respectively, in 2013. Fiscal consolidation in both countries improved the debt burden. Turkey managed to

Percent 190 160 130 100 70 40 10 Greece Italy Ireland Portugal Cyprus 2008 2013

Source: World Bank Public Sector Debt Database.

keep its debt-to-GDP ratio the same as in 2012 (36 percent).

The size of domestic debt markets in developing economies continued to grow in 2013. Learning from the financial crisis, the governments in many developing economies expanded domestic credits, which increased the size of domestic debt dramatically. The majority of this debt is in domestic currency, so countries can avoid the risk of exchange rate fluctuation. As of December 2013, the estimated size of local currency debt among developing economies (excluding China with 99 percent) averaged 78 percent of the total debt. This was a 2 percentage point increase since the financial crisis, although Turkey showed a decrease of 2 percentage points (see Figure O.33).

Figure 0.34 Bonds to government debt

Source: World Bank Public Sector Debt Database.

The government debt is mainly financed by long-term debt securities as a safe opportunity of funding the budget deficits. About 99.8 percent of the central government debt of China is financed by long-term bonds. With the new regulation of Parliament, the local government is authorized to issue bonds. This reflects a reform that will further help the government to finance its projects. Excluding China, the bond issuance from governments in the developing economies that report to the Public Sector Debt database averaged 80 percent of the total debt. From 2009 to 2013, Hungary and Indonesia increased their bond ratios by 9 percentage points, Mexico by 6 percentage points, followed by South Africa and Brazil (an average of 2 percentage points each) (see Figure O.34).

Notes:

Large interest payment was made during 2007 to a creditor country to settle a long standing claim. Short-term debt is based on data from the BIS.

LIBERIA

Notes:

Data from 2001 include late interest fee owed to Paris Club and Commercial Creditors. Short-term debt is based on data from the BIS.

APPENDIX

About the Data

Data Sources and Methodology

Data Sources

The principal sources of information for **I** the tables in *International Debt Statistics* 2015 are reports to the World Bank through the World Bank's Debtor Reporting System (DRS) from member countries that have received either International Bank for Reconstruction and Development (IBRD) loans or International Development Association (IDA) credits. The DRS has its origin in the World Bank's need to monitor and assess the financial position of its borrowers. Since 1951, borrowers have been required to provide statistics on their public external debt and private sector debt that benefit from a public guarantee. In its design, consistency, and continuity of coverage, the DRS is a unique resource. Reporting countries submit detailed reports on the annual status, transactions, and terms of the long-term external debt of public agencies and that of private ones guaranteed by a public agency in the debtor country. The DRS maintains these records on a loan-by-loan basis. In 1973, coverage of the DRS was expanded to include private sector nonguaranteed borrowing, but for this category of debt, data are provided by borrowers in aggregate rather than loan by loan.

Data submitted to the DRS are processed in the World Bank External Debt (WBXD) system, along with additional information received from the files of the African Development Bank, the Asian Development Bank, the Inter-American Development Bank (IDB), the International Monetary Fund (IMF), institutions of the World Bank Group (IBRD and IDA), and the European Bank for Reconstruction and Development (EBRD). The WBXD is an internal system of the World Bank. Among its outputs is the International Debt Statistics (IDS) database, from

which the tables in this publication and online database are produced.

Data on exports and imports (on a balance of payments basis), international reserves, current account balances, foreign direct investment (FDI) on equity, portfolio equity flows, and primary income of FDI are drawn mainly from the files of the IMF, supplemented by United Nations Conference on Trade and Development (UNCTAD) reports and country data. Balance of payments data are presented according to the sixth edition of the IMF's Balance of Payments Manual (BPM6). Official aid flows come from data collected and published by the Development Assistance Committee (DAC) of the Organisation for Economic Co-operation and Development (OECD). Short-term external debt data are as reported by debtor countries or are estimates based on the Bank for International Settlements (BIS) quarterly series of commercial banks' claims on developing countries. For some countries, estimates were prepared by pooling creditor and debtor information. Data on the gross national income of most developing countries are collected from national statistical organizations or central banks by visiting and resident World Bank missions.

Every effort has been made to ensure the accuracy and completeness of the external debt statistics. Coverage has been improved through the efforts of the reporting agencies and close collaboration between the Bank and our partners, Commonwealth Secretariat (COMSEC) and UNCTAD, which provide debt recording and reporting systems across the globe, as well as through the work of the World Bank missions, which visit member countries to gather data and to provide technical assistance on debt issues. Nevertheless, quality and coverage vary among

debtors and may also vary for the same debtor from year to year. Data on long-term external debt reported by member countries are checked against, and supplemented by, data from several other sources. Among these sources are the statements and reports of several regional development banks, government lending agencies, and official government Web sites.

Methodology

Aggregations

Total debt stock and other aggregate measures are derived from the summation of loan-level data on stocks and flows after conversion to a common currency. Other tabulations are compiled using terms and conditions reported in the loan-level data, such as currency composition, cancellations, rescheduling of other liabilities into long-term public and publicly guaranteed external debt, and debt buybacks.

Aggregates for regional and income groups are based on the World Bank's operational classifications, which may differ from common geographic usage or income groups used by other organizations. Country classifications of DRS reporting countries in 2013 are shown in country groups in the back of the publication. The same classification is used for all historical data shown in *International Debt Statistics* and the online tables and online database.

Currency Conversion

Data on external obligations are normally reported to the World Bank in the currency of repayment and are converted into a common currency (U.S. dollars) using official exchange rates published by the IMF.

Commitments, disbursements, and debt service payments (flows) are converted to U.S. dollars at the annual average exchange rate for the year. Debt outstanding (disbursed and undisbursed) at the end of a given year (stock) is converted at the exchange rate in effect at the end of the relevant year. Consequently, year-to-year changes in debt outstanding and disbursed may not be equal to net flows (disbursements less principal repayments); similarly, changes in debt outstanding (including undisbursed debt) may not equal commitments less repayments. Discrepancies will be particularly

significant when exchange rates have moved sharply during the year. Projected debt service is converted to U.S. dollars at rates in effect at the end of December 2012.

Beginning with 1991, all ruble debt owed to the former Soviet Union has been converted at a rate of US\$1 = 0.6 ruble, except in cases where a bilateral agreement specifying a different conversion rate is in place. Adoption of this methodology does not constitute an endorsement by the World Bank staff of the appropriateness or validity of the exchange rate used. That matter must be resolved bilaterally between the Russian Federation and its debtor countries.

Starting with the 1988–89 edition of World Debt Tables (a predecessor of IDS), all data pertaining to IBRD loans from 1985 onward are recorded at their current market value. Starting with the 1991–92 edition, all data pertaining to Asian Development Bank loans from 1989 onward are recorded at their current market value. Starting with the 1998 edition, all data pertaining to African Development Bank and African Development Fund loans from 1997 onward are recorded at their current market value.

Debt Stock and Flow Reconciliation

Because of currency conversions and the timing of transactions, there may be differences between the change in aggregate stocks from one period to the next and flows during the relevant period; changes in debt outstanding, including undisbursed amounts, will therefore differ from commitments less repayments.

Changes in the stock of debt from one period to the next can be attributed to five factors: the net flow of debt, the net change in interest arrears, the capitalization of interest, a reduction in debt resulting from debt forgiveness or other debt reduction mechanisms, and cross-currency valuation effects. Any residual difference in the change in stock not explained by one of those five factors may indicate inconsistencies in the reported data or specific phenomena prevailing in an individual country (for example, an incomplete historical series for all categories of debt). Starting in 1989, the IDS includes the debt stock reconciliation, but not all components are shown in the IDS print edition and online tables.

External Debt Restructuring

Starting in 1985, the WBXD includes information on the restructuring of debt by official creditors in the context of the Paris Club, restructuring by commercial creditors, debt swap operations, buybacks, and bond exchanges. It attempts to capture accurately the effect of debt restructuring on both external debt stocks and external debt flows, consistent with the terms on which the restructuring takes place. In the compilation and presentation of external debt data, a distinction is made between cash flows and imputed flows. According to this criterion, restructured service payments and the shift in liabilities from one financial instrument to another as a result of debt restructuring are considered to be imputed flows. Both cash flows and imputed flows are recorded separately in WBXD.

The imputed flows and stock changes associated with debt restructuring are included in the IDS tables and online database to complement the cash-basis transactions recorded in the main body of the data. Such data encompass information on the debt stock and debt flows restructured each year, the amount of principal forgiven (interest forgiven is shown as a memorandum item), and the amount of external debt stock reduced either by forgiveness or by a debt buyback operation. Changes in creditors and debtors that result from debt restructuring are also reflected. For example, when insured commercial credits are rescheduled, the creditor classification shifts from private to official (bilateral), reflecting the assumption of the assets by the official credit insurance agencies in the creditor country. The IDS data will show a reduction in the external debt owed to the original private creditors equal or similar to the amount of debt restructured and a corresponding increase in the debt owed to the new official creditor. Similarly on the debtor side, when a government accepts responsibility for the payment of restructured debt previously owed by a private enterprise, the relevant change in the debtor category will be reflected. Likewise, if short-term external debt is restructured into a long-term obligation, the stock of short-term external debt will decline and the stock of long-term external debt will rise by the amount of short-term debt restructured. In the event of a debt swap of long-term external debt (external debt to equity, external debt for nature, or external debt for development), the face value of the external debt swapped will be recorded as a decline in long-term external debt stock, but no flow transaction (principal repayment) will be recorded

Projections of Future Disbursements and Debt Service Payments

The WBXD system projects future disbursements and future debt service payments on the assumption that every existing loan commitment will be fully used and repaid in full.

Future Disbursements

Disbursement projections are made using one of the following methods:

- *Specific schedules*. Debtor countries are requested to submit a schedule of future disbursements, if available, at the time each new loan is first reported.
- Standard schedules. In the absence of specific schedules, the WBXD system projects the future disbursement schedule according to the undisbursed balance of each loan at the end of the most recent reporting period.

These projected schedules are based on profiles derived from the disbursement pattern of comparable loans that fully disbursed. Thirty different profiles have been compiled corresponding to each category of creditor and, in the case of official creditors, for concessional and nonconcessional loans. Each profile is derived by applying regression analysis techniques to a body of data on actual disbursements for each fully disbursed loan in the WBXD database. The profiles are periodically updated to take into account the evolving pattern of disbursements observed for fully disbursed loans.

Future principal payments are generated by the WBXD system according to the repayment terms of each loan. Principal repayments (amortization) are based on the amount of the loan commitment. If the amortization schedule follows a set pattern (for example, equal semiannual payments), the WBXD system calculates repayments automatically using the loan commitment amount, the first and final payment dates, and the frequency of the payments. If future payments are irregular, the WBXD system requires a schedule.

Future interest payments are generated by the WBXD system according to the disbursed and

outstanding balance of the loan at the beginning of the period. Using the interest rate specified in the loan contract, the first and final interest payment dates, and the frequency of payments, the WBXD system calculates the stream of future interest payments due. If interest payments are irregular, the WBXD system requires a schedule.

Future debt service payments are the sum of future principal and interest payments due on existing commitments, including the undisbursed portion. They do not include debt service payments that may become due as a result of new loans contracted in subsequent years, nor do they take into account the effect of any change to future debt service obligations resulting from actions such as prepayment or rescheduling or from cancellations that occurred after the most recent year-end data reported to the DRS.

Both projected disbursements and future debt service payments are converted into U.S. dollars using end-December 2012 exchange rates. Likewise, future interest payments on loans with a variable interest rate (for example, loans from commercial banks tied to the London Interbank Offered Rate [LIBOR]) are based on the interest rate prevailing at end-December 2012.

Treatment of Arrears

The DRS collects information on arrears of both principal and interest. Principal in arrears is included in the amount of long-term external debt outstanding and is shown separately. Interest in arrears on long-term external debt and interest in arrears on the use of IMF credit are included as part of short-term external debt outstanding and are shown separately. Clearance of interest in arrears by repayment will be recorded as an interest payment in the relevant creditor category of the loan (or loans) on which the arrears were incurred, as a corresponding reduction in the level of short-term debt outstanding, and as a net reduction in interest arrears. Clearance of interest arrears through debt restructuring or forgiveness will be recorded as a reduction in the level of short-term debt outstanding and a net reduction in interest arrears. When interests are rescheduled, they will be capitalized: This change will be recorded as an increase in long-term debt outstanding equal to the amount of interest capitalized and the reduction in short-term debt outstanding noted previously.

External Debt and Its Components

This section describes the compilation of the major components of external debt included in the IDS tables and database and the relationship between them, as shown in figure A.1 on the next page. Information about general methods of compiling external debt data is discussed in the previous section titled "Methodology." For concise definitions, see the glossary.

Total External Debt

Total external debt shown in the IDS is the sum of long-term external debt, short-term debt, and IMF credit. It represents the total debt owed to nonresident creditors and is repayable in both foreign and domestic currency.

Short-Term Debt

Short-term debt is defined as external debt with an original maturity of one year or less. The DRS requires debtor countries to report only on their long-term external debt. However, to gain a comprehensive picture of total external obligations, the World Bank encourages debtor countries to voluntarily provide information on their short-term external obligations.

By its nature, short-term external debt is difficult to monitor: Loan-by-loan registration is normally impractical, and monitoring systems typically rely on information requested periodically by the central bank from the banking sector. The World Bank regards the debtor country as the authoritative source of information on its short-term debt. Unless otherwise specified in the country tables, the data for short-term debt are derived from the data provided by the quarterly external debt statistics (QEDS) database. QEDS was jointly developed by the World Bank and the IMF and provides detailed external debt data of countries that subscribe to the IMF's Special Data Dissemination Standard (SDDS) and a selected number of countries that participate in the IMF's General Data Dissemination System (GDDS). The data are compiled according to the External Debt Statistics, Guide for Compilers and Users. BIS data on international bank lending is the second source of the short-term debt. These data are reported on the basis of residual maturity, but an estimate of short-term external liabilities by original maturity can be derived by deducting from claims due in one year those that, 12 months earlier, had a

Figure A.1. External Debt and Its Components

maturity of between one and two years. However, not all commercial banks report to the BIS in a way that allows the full maturity distribution to be determined, and the BIS data include liabilities only to banks within the BIS reporting area. Consequently, the results should be interpreted with caution.

The flow of short-term debt may be derived from the change in claims (stock) data in the BIS quarterly series over consecutive periods, but valuation adjustments resulting from exchange rate movements will affect the calculations, as will prepayment and refinancing of long-term maturities falling due. When short-term external debt has been rescheduled, lags in reporting and differences in the treatment of the rescheduled external debt by debtors and creditors may result in double counting.

Interest in arrears on long-term external debt and interest in arrears on the use of IMF credit are added to short-term debt and are separately identified.

Use of IMF Credit

Data related to the operations of the IMF are provided by the IMF Treasurer's Department. They are converted from special drawing rights (SDR) into dollars using end-of-period exchange rates for stocks and average-over-the-period exchange rates for flows. IMF trust fund operations under the Enhanced Structural Adjustment Facility, Extended Fund Facility, Poverty Reduction and Growth Facility, and Structural Adjustment Facility (Enhanced Structural Adjustment Facility (Enhanced Structural Adjustment Facility in 1999) are presented together with all of the IMF's special facilities (buffer stock, supplemental reserve,

compensatory and contingency facilities, oil facilities, and other facilities). SDR allocations are also included in this category. According to the BPM6, SDR allocations are recorded as the incurrence of a debt liability of the member receiving them (because of a requirement to repay the allocation in certain circumstances, and also because interest accrues). This debt item was introduced for the first time in IDS 2013 with historical data starting in 1999.

Long-Term Debt

Long-term debt has an original maturity of more than one year. It comprises the obligations of both public and private debtors. Private nonguaranteed debt comprises the external obligations of private debtors that are not guaranteed for repayment by a public entity in the debtor country.

Public and publicly guaranteed debt comprises the external obligations of public debtors and has two components: (a) public debt, which is borrowing by the national government or agency, by a political subdivision or agency, or by autonomous public bodies, and (b) publicly guaranteed debt, which is borrowing by a private agency that is guaranteed for repayment by a public entity.

Private Nonguaranteed Debt

The DRS reporting requirements were expanded in 1973 to include long-term private nonguaranteed debt. Data are reported annually on an aggregate basis and include, for the reporting year, the total amount of disbursed and outstanding debt; the amount of disbursements, principal repayments, and interest payments; the principal and interest rescheduled; and the projected principal and interest payments for future years. The aggregate data are usually reported in U.S. dollars, and no information on the underlying currency composition is given.

DRS reporting countries recognize the importance of monitoring borrowing by their private sector, particularly when it constitutes a significant portion of total external debt, but many countries acknowledge the difficulty of this process. Detailed data are available only when countries have registration requirements for private nonguaranteed debt in place, most commonly in connection with exchange controls. When formal registration of private nonguaranteed debt is not mandatory, compilers must rely on balance of payments data and financial surveys.

The data on private nonguaranteed debt in this publication is as reported or as estimated for countries where this type of external debt is known to be significant. The estimation of private nonguaranteed debt is based on the national data on quarterly external debt statistics (QEDS) or IMF data. Flows are derived from the change in stock over consecutive periods and are adjusted for the effects of exchange rate movements (assuming the currency composition mirrors that of public and publicly guaranteed debt) and for any known debt restructuring. Principal repayments are estimated on the basis of the average maturity observed for loans to private sector borrowers in countries reporting to the DRS and on the basis of the stock of debt outstanding. Interest payments are estimated on the basis of the stock of debt outstanding and interest rates prevailing in international capital markets.

Balance of payments data provide a useful guideline in the estimation process: private non-guaranteed external debt may be derived as a residual between net long-term external borrowing recorded in the balance of payments and net long-term public and publicly guaranteed external debt reported to the DRS.

Public and Publicly Guaranteed Debt

Data related to public and publicly guaranteed debt are reported to the DRS on a loan-by-loan basis. The data provide annual information on the disbursed and outstanding balance and the undisbursed balance of each loan, the cumulative disbursements, the principal and interest paid and principal and interest restructured in the reporting year, and the stock of any outstanding payment's arrears of principal and interest. Detailed information on the terms and conditions of each loan is also reported. Public debt and publicly guaranteed debt are shown as a single line in this publication and then further disaggregated by creditor type and, in the case of private creditors, by type of credit instrument.

Official Creditors

Official creditors include multilateral and bilateral lenders. In general, official creditors provide loans (and, in some cases, provide grants) to public bodies, although in some cases they may lend to other entities with a public guarantee.

Multilateral creditors are international financial institutions such as the World Bank, regional development banks, and other multilateral and intergovernmental agencies whose lending is administered on a multilateral basis. Funds administered by an international financial organization on behalf of a single donor government constitute bilateral loans (or grants). For lending by a number of multilateral creditors, the data presented in this publication are taken from the creditors' records. Such creditors include the African Development Bank, the Asian Development Bank, the IDB, IBRD, and IDA. (IBRD and IDA are institutions of the World Bank.)

Bilateral creditors are governments and their agencies, including central banks, aid agencies, official export credit agencies, and autonomous agencies such as the U.S. Department of Agriculture or the Federal Home Loan Bank. Member countries of the OECD Development Assistance Committee (DAC) and some other countries also report information on loans extended bilaterally or officially guaranteed to the Creditor Reporting System of the OECD.

Private Creditors

Private creditors include commercial banks, bondholders, and other private creditors. This line includes only publicly guaranteed creditors. Nonguaranteed private creditors are shown separately.

Bonds include publicly issued or privately placed bonds.

Commercial bank loans are loans from private banks and other private financial institutions.

Credits of other private creditors include credits from manufacturers, exporters, and other suppliers of goods, plus bank credits covered by a guarantee of an export credit agency. This line is included in the online database but is not shown in the published tables. It can be obtained as the difference between (a) credits of total private creditors and (b) bonds and commercial bank loans.

Sources of the Macroeconomic Indicators

The macroeconomic data are prepared by The World Bank from a variety of sources. Data on Personal Transfers and Compensation of Employees are prepared by World Bank staff based on IMF balance of payments statistics. Data on foreign direct investments are prepared by World Bank staff based on IMF balance of payments statistics and UNCTAD publication. Other macroeconomic data are from IMF balance of payments statistics.

Data on exports of goods, services, and primary income are gap-filled with countries' balance of payments statistics for the following countries:

Algeria (2013)	Kenya (2013)	Senegal (2012)
Burkina Faso (from 2011)	Madagascar (from 2006)	Serbia (2013)
Comoros (from 2005)	Mali (2012)	Seychelles (2013)
Côte d'Ivoire (2011)	Mauritania (from 2006)	Swaziland (2013)
Fiji (2013)	Niger (2011)	Tanzania (2013)
Ghana (2013)	Nigeria (2013)	Togo (2011)
Guinea-Bissau (from 2011)	Peru (2013)	
Indonesia (2013)	São Tomé and Príncipe (2013)	

Data on imports of goods, services, and primary income are gap-filled with countries' balance of payments statistics for the following countries:

Algeria (2013)	Kenya (2013)	Senegal (2012)
Burkina Faso (from 2011)	Madagascar (from 2006)	Serbia (2013)
Comoros (from 2005)	Mali (2012)	Seychelles (2013)
Côte d'Ivoire (2011)	Mauritania (from 2006)	Swaziland (2013)
Fiji (2013)	Niger (2011)	Tanzania (2013)
Ghana (2013)	Nigeria (2013)	Togo (2011)
Guinea-Bissau (from 2011)	Peru (2013)	
Indonesia (2013)	São Tomé and Príncipe (2013)	

Data on current account balance are based on countries' balance of payments statistics for the following countries:

Algeria (2013) Indonesia (2013) Serbia (2013) Benin (2012) Kenya (2013) Seychelles (2013) Bolivia (2013) Liberia (2012) Swaziland (2013) Burkina Faso (from 2011) Madagascar (from 2006) Tajikistan (2013) Central African Republic (from 2005) Mali (2011) Tanzania (2013) Mauritania (from 2007) Chad (from 2005) Togo (2011)

Comoros (from 2005) Niger (2011) Zimbabwe (from 2005)

Côte d'Ivoire (2011) Nigeria (2013) Fiji (2013) Peru (2013)

Gabon (from 2006) São Tomé and Príncipe

Ghana (2013) (2013)

Guinea-Bissau (from 2011) Senegal (2012)

Data on personal transfers and compensation of employees are based on countries' balance of payments statistics for the following countries:

Indonesia (2013) Peru (2013)

Data on portfolio equity are based on countries' balance of payments statistics for the following countries:

Burkina Faso (from 2011)

Indonesia (2013) Nigeria (2013)

Note: Letters in parenthesis indicate DRS reporters' status: (A) as reported, (P) preliminary, and (E) estimated. The status "as reported" indicates that the country was fully current in its reporting under the DRS and that World Bank staff are satisfied that the reported data give an adequate and fair representation of the country's total public debt. "Preliminary" data are based on reported or collected information, but because of incompleteness or other reasons, an element of staff estimation is included. "Estimated" data indicate that countries are not current in their reporting and that a significant element of staff estimation has been necessary in producing the data tables.

a. For Bosnia and Herzegovina, total debt before 1999, excluding IBRD and IMF obligations and short-term debt, is included under Serbia.

b. Data prior to 2006 include Montenegro. c. Data include South Sudan.

Note: Low-income economies are those with a GNI per capita of \$1,045 or less in 2013. Middle-income economies are those with a GNI per capita of more than \$1,046 but less than \$12,745. Italicized countries are IDA-only countries as of July 1, 2014; IDA-only excludes blend and IBRD countries.

Glossary

Debt Reporting System (DRS)

Average terms of new commitments provide information on the interest rate, maturity, and grace period of new commitments on public and publicly guaranteed external debt contracted with public and private creditors. Averages are weighted by the amounts of the loans.

Bilateral official creditors are official agencies that make loans on behalf of one government to another government or to public (and, in some cases, private) borrowers in another country.

Bonds are debt instruments issued by public and publicly guaranteed or private debtors with durations of one year or longer. Bonds usually give the holder the unconditional right to fixed money income or contractually determined, variable money income.

Commercial banks are private banks that provide loans and other financial services.

Commitments of public and publicly guaranteed debt constitute the total amount of new long-term loans to public sector borrowers or borrowers with a public sector guarantee extended by official and private lenders and for which contracts were signed in the year specified.

Concessional debt conveys information about the borrower's receipt of aid from official lenders at concessional terms as defined by the DAC, that is, loans with an original grant element of 25 percent or more. Loans from major regional development banks—African Development Bank, Asian Development Bank, and the Inter-American Development Bank—and from the World Bank are classified as concessional according to each institution's classification and not according to

the DAC definition, as was the practice in earlier reports.

Contractual obligations on outstanding long-term external debt are the anticipated debt service payments on long-term external debt contracted up to December 31 of the reporting year.

Currency composition of public and publicly guaranteed debt provides information on the share of loans outstanding and disbursed by currency of repayment. For major multilateral creditors, the currency composition of the relevant unit of account is also taken into account. The principal currencies in which the external debt of low- and middle-income countries is contracted (the euro, Japanese yen, U.S. dollar, SDR, and all other currencies) are separately identified. Beginning in 2001, debt denominated in the currencies of the members in the Euro Area is included under the euro rather than the national currencies that previously prevailed.

Current account balance shows the difference between the sum of exports and income receivable and the sum of imports and income payable (exports and imports refer to both goods and services, while income refers to both primary and secondary income).

Debt buyback is the repurchase by a debtor of its own debt, either at a discount price or at par value. In the event of a buyback of long-term debt, the face value of the debt bought back will be recorded as a decline in stock outstanding of long-term debt, and the cash amount received by creditors will be recorded as a principal repayment. For example, if a country buys back long-term external debt of face value B at a price P, then long-term external debt will decline by B,

and principal repayment will increase by P. The difference between the price at which the debt was bought back and the face value is recorded as a debt stock write-off (the related transactions are not separately identified in the International Debt Statistics [IDS] publication but are available in the online database).

Debt forgiveness grants include both debts canceled by agreement between debtor and creditor and reductions in the net present value of official nonconcessional loans resulting from concessional rescheduling or refinancing. Data are recorded on a disbursement basis and include debt forgiveness from bilateral and multilateral creditors.

Debt outstanding and disbursed is the value at year's end of long-term external debt owed by public and publicly guaranteed debtors and private nonguaranteed debtors.

Debt restructurings are revisions to debt service obligations agreed on by creditors and debtors. Such agreements change the amount and timing of future principal and interest payments.

Debt service to exports is the ratio of the sum of principal repayments and interest paid on total long-term debt (public and publicly guaranteed debt and private nonguaranteed debt) to the value of exports of goods and services and receipts of primary income from abroad.

Debt stock-flow reconciliation shows the indicators that affect the change in debt stocks from one period to the next.

Disbursements are drawings during the year specified on loan commitments contracted by the borrower.

Exports of goods, services, and primary income constitute the total value of exports of goods and services, receipts of compensation of nonresident workers, and investment income from abroad.

External debt flows are debt-related transactions during the year specified. They include disbursements, principal repayments, and interest payments.

External debt stocks comprise public and publicly guaranteed long-term external debt, private non-guaranteed long-term external debt, use of IMF credit, and short-term external debt, including

interest arrears on long-term debt. The relation between external debt stock and its components is illustrated on page 159 (figure A.1).

External debt stocks to exports is the ratio of outstanding external debt to the value of exports of goods and services and receipts of primary income from abroad.

External debt stocks to GNI is the ratio of outstanding external debt to gross national income.

Foreign direct investment refers to direct investment equity flows in the reporting economy. It is the sum of equity capital, reinvestment earnings, and other capital. Direct investment is a category of cross-border investment associated with a resident in one economy having control or a significant degree of influence on the management of an enterprise that is resident in another economy. Ownership of 10 percent or more of the ordinary shares or voting stock is the criterion for determining the existence of a direct investment relationship.

Grace period is the time between the date on which a loan is committed and the date on which the first principal payment is due. The information presented in International Debt Statistics is the average grace period on all public and publicly guaranteed debt committed during the specified period.

Grants are legally binding commitments that obligate a specific value of funds available for disbursement for which there is no payment requirement. They include debt forgiveness grants and grants from bilateral and multilateral agencies (such as the International Development Association).

Gross national income (GNI) is the sum of value added by all resident producers, plus any product taxes (less subsidies) not included in the valuation of output, plus net receipts of primary income compensation of employees and property income from abroad. Yearly average exchange rates are used to convert GNI from local currency to U.S. dollars.

Heavily Indebted Poor Country (HIPC) Initiative is a program of the World Bank and the International Monetary Fund (IMF) to provide debt relief to qualifying countries with unsustainable debt burdens.

Imports of goods, services, and primary income constitute the total value of goods and services imported and income payable to nonresidents. Interest arrears on long-term debt are interest payments due but not paid, shown on a cumulative basis.

Interest arrears are due and payable immediately and are therefore regarded as short-term obligations. Thus, an increase in interest arrears on long-term debt will be recorded as an increase in short-term debt. Interest in arrears on the use of IMF credit is also considered to be part of short-term external debt.

Interest payments are the amounts of interest paid in foreign currency, goods, or services in the year specified.

Interest rate is the interest rate applicable to a loan commitment as specified in the loan contract. The information presented in International Debt Statistics is the average interest on all public and publicly guaranteed debt committed during the specified period.

International Bank for Reconstruction and Development (IBRD) is a multilateral official creditor. IBRD is the nonconcessional lending arm of the World Bank Group.

International Development Association (IDA) is a multilateral official creditor. It is the concessional financing arm of the World Bank Group. IDA also provides grant financing to qualified borrowers.

IMF charges are the amounts of interest paid in foreign currency in the year specified for transactions with the IMF.

IMF purchases are the total drawings on the general resources account of the IMF during the year specified, excluding drawings in the reserve tranche.

IMF repurchases are the amounts of principal (amortization) paid in foreign currency in the year specified for transactions with the IMF.

International reserves constitute the sum of a country's monetary authority's holdings of special drawing rights, its reserve position in the IMF, its holdings of foreign exchange, and its holdings of gold (valued at year-end London prices).

Long-term external debt is debt that has an original or extended maturity of more than one year and that is owed to nonresidents by residents of an economy and is repayable in foreign currency, goods, or services.

Long-term private sector debt is long-term debt owed by the private sector, whether publicly guaranteed or not.

Long-term public sector debt is long-term external debt owed by the public sector.

Maturity is the date on which the final principal repayment on a loan is due. It is the sum of the grace and repayment periods. The information presented in International Debt Statistics is the average maturity on all public and publicly guaranteed debt committed during the specified period.

Multilateral Debt Relief Initiative (MDRI) is a program of the World Bank, the IMF, the Inter-American Development Bank, and the African Development Bank that provides additional debt relief to countries that have completed the HIPC process.

Multilateral official creditors are official agencies owned or governed by more than one country that provide loan financing. They include international financial institutions such as the World Bank, regional development banks, and other intergovernmental agencies.

Multilateral to external debt stocks is the ratio of the stock of debt owed to multilateral creditors to total external debt.

Net flows on external debt are disbursements on long-term external debt and IMF purchases minus principal repayments on long-term external debt and IMF repurchases. Up to 1984, this calculation included only long-term external debt and IMF flows. Since 1985, the calculation includes the change in stock of short-term debt (excluding interest arrears on long-term external debt).

Official creditors are governments or other bilateral public entities, such as export-import agencies, development agencies, and multilateral financial institutions, such as the World Bank and regional development banks.

Personal transfers and compensation of employees is the sum of personal transfers and compensation of employees. Personal transfers consist of all current transfers in cash or in kind made or received by resident households to or from nonresident households. Personal transfers thus include all current transfers between resident and nonresident individuals. Compensation of employees refers to the income of border, seasonal, and other short-term workers who are employed in an economy where they are not resident and of residents employed by nonresident entities.

Portfolio equity is the category of international investment that covers investment in equity securities. Equity securities include shares, stocks, participation, or similar documents (such as American Depositary Receipts) that usually denote ownership of equity.

Present value of debt outstanding is the nominal value of all future debt service obligations on existing debt discounted at prevailing market rates of interest. The interest rates used in this calculation are the Commercial Interest Reference Rates (CIRR) for each relevant currency compiled and published by the Organisation for Economic Cooperation and Development.

Primary income on FDI are payments of direct investment income (debit side), which consist of income on equity (dividends, branch profits, and reinvested earnings) and income on the intercompany debt (interest).

Principal arrears on long-term debt are principal repayments due but not paid on long-term external debt, shown on a cumulative basis.

Principal repayments are the amounts of principal (amortization) paid in foreign currency, goods, or services in the year specified with respect to long-term external debt.

Private creditors are bondholders, commercial banks, and other trade-related lenders.

Private nonguaranteed debt is debt owed by private sector borrowers to external creditors on loans that do not benefit from a public sector guarantee by the debtor country.

Public and publicly guaranteed debt outstanding and disbursed is the value of debt at year's end of public sector borrowers, or borrowers with a public sector guarantee, owed to official and private lenders.

Public and publicly guaranteed external debt comprises public debt (an external obligation of a public debtor, such as the national government or agency, a political subdivision or agency, or an autonomous public body) and publicly guaranteed external debt (an external obligation of a private debtor that is guaranteed for repayment by a public entity).

Public debt is an external obligation of a public debtor, including the national government, a political subdivision (or an agency of either), and autonomous public bodies.

Publicly guaranteed debt is an external obligation of a private debtor that is guaranteed for repayment by a public entity.

Reserves to external debt stocks is the ratio of international reserves to outstanding external debt.

Reserves to imports (months) is the ratio of international reserves to the value of imports of goods, services, and primary income in the year shown and is expressed in months:

Reserves Imports/12

Short-term external debt has an original maturity of one year or less. Available data permit no distinction among public, publicly guaranteed, and private nonguaranteed short-term external debt

Short-term to external debt stock ratio is the ratio of short-term external debt to total outstanding external debt.

Special Drawing Rights (SDRs) refer to an international reserve asset that was created by the IMF in 1969 to supplement its member countries' official reserves. The value of SDRs is based on a basket of four key international currencies: the U.S. dollar, the pound sterling, the Japanese yen, and the euro. In addition to playing a role as a supplementary reserve asset, SDRs serve as the unit of account for the IMF and some other international organizations.

Technical cooperation grants include (a) freestanding technical cooperation grants, which are intended to finance the transfer of technical and managerial skills or of technology for the purpose of building up general national capacity without reference to any specific investment projects, and (b) investment-related technical cooperation grants, which are aimed at strengthening the capacity to execute specific investment projects.

Total amount forgiven is the total amount of principal and interest due, principal and interest in arrears, and debt stock forgiven in the year specified.

Total amount rescheduled is the total amount of external debt rescheduled, including principal and interest due, principal and interest in arrears, charges, penalties, and debt stock in the year specified.

Total change in external debt stocks is the difference in the external debt stock between two consecutive years.

Use of IMF credit denotes members' drawings on the IMF other than amounts drawn against the country's reserve tranche position. Use of IMF credit includes purchases and drawings under Stand-By, Extended, Structural Adjustment, Enhanced Structural Adjustment, and Systemic Transformation Facility Arrangements as well as trust fund loans. SDR allocations are also included in this category.

Quarterly Debt Statistics

Central bank sector is identical to the definition of that subsector in the 2008 System of National Accounts (SNA). The central bank is the financial institution (or institutions) that exercises control over key aspects of the financial system. It carries out such activities as issuing currency, managing international reserves, transacting with the IMF, and providing credit to deposit-taking corporations.

Central government subsector consists of the institutional unit(s) of the central government plus those nonmarket Non-profit institutions that are controlled by the central government. The political authority of the central government extends over the entire territory of the country.

Currency and deposits consist of notes and coins and deposits (both transferable and other).

Notes and coins represent claims of a fixed nominal value usually on a central bank or government; commemorative coins are excluded. Deposits include all claims that are (a) on the central bank, deposit-taking corporations other than the central bank, and, in some cases, other institutional units; and (b) represented by evidence of deposit.

Debt liabilities owed by residents to residents of the same economy are classified as *domestic debt*, and debt liabilities owed by residents to nonresidents are classified as *external debt*. The definition of residence follows the current international standards (the System of National Accounts 2008 [2008 SNA] and the *Balance of Payments and International Investment Position Manual*, Sixth Edition [BPM6]).

Debt securities are negotiable financial instruments serving as evidence of a debt. The security normally specifies a schedule for interest payments and principal repayments. Examples of debt securities are bills, bonds, and debentures, including bonds that are convertible into shares, commercial paper, negotiable certificates of deposit, loans that have become negotiable from one holder to another, nonparticipating preferred stocks or shares, asset-backed securities and collateralized debt obligations, banker's acceptances, and similar instruments normally traded in the financial markets.

Deposit-taking corporations, except the central bank sector is identical with the corresponding subsector in the 2008 SNA. It includes commercial banks, institutions such as savings banks, savings and loan associations, credit unions or cooperatives, traveler's check companies, and specialized banks or other financial institutions if they take deposits or issue close substitutes for deposits Post office savings banks or other government-controlled savings banks are also included if they are institutional units separate from the government. Deposit-taking corporations that engage exclusively (or almost exclusively) with nonresidents, often called offshore banks or offshore banking units, are included in the deposit-taking corporations sector, but they may be excluded from the money-issuing sector because their liabilities are not included in broad money.

General government sector is identical with the definition of that sector in the 2008 SNA. The government units of a country consist of those

authorities and their agencies that are units established by political processes and exercise legislative, judicial, and executive authority over other institutional units within a given territorial area. General government agencies that are residents of an economy include all departments, establishments, and bodies located in the economic territory of an economy's central, state, and local governments and all embassies, consulates, military establishments, and other entities, which are located elsewhere, of an economy's general government.

Insurance, pension, and standardized guarantee schemes comprise (a) nonlife insurance technical reserves, (b) life insurance and annuity entitlements, (c) pension entitlements, claims of pension funds on pension managers, and entitlements to nonpension funds, and (d) provisions for calls under standardized guarantees.

Loans include those financial assets created through the direct lending of funds by a creditor (lender) to a debtor (borrower) through an arrangement in which the lender either receives no security evidencing the transactions or receives a nonnegotiable document or instrument.

Other accounts receivable/payable covers items other than equity; currency and deposits; loans; insurance, pension, and standardized guarantee schemes; trade credit and advances; and SDRs.

Other sectors comprises other financial corporations (i.e., other than deposit-taking corporations), nonfinancial corporations, and households and nonprofit institutions serving households (NPISHs) subsectors.

SDR allocations are recorded as the incurrence of a debt liability of the member receiving them (because of a requirement to repay the allocation in certain circumstances, and also because of interest accrues).

Trade credit and advances consist of liabilities arising from the direct extension of credit by suppliers for transactions in goods and services, and advance payments by buyers for goods and services and for work in progress (or to be undertaken).

ECO-AUDIT Environmental Benefits Statement

The World Bank is committed to preserving endangered forests and natural resources. The Office of the Publisher has chosen to print *International Debt Statistics 2015* on recycled paper with 50 percent post-consumer waste, in accordance with the recommended standards for paper usage set by the Green Press Initiative, a non-profit program supporting publishers in using fiber that is not sourced from endangered forests. - 3,926 gallons of water
- 263 lbs. of solid waste

International Debt Statistics 2015 is a continuation **⊥**of the World Bank's Global Development Finance, Volume II (1997 through 2009) and the earlier World Debt Tables (1973 through 1996). This year's edition of International Debt Statistics is designed to respond to user demand for timely, comprehensive data on trends in external debt in developing countries. As in previous years, *International Debt* Statistics provides statistical tables showing the external debt of 124 developing countries that debt to the World Bank's Debtor Reporting System (DRS). In addition, this report showcases the broader spectrum of debt data collected and compiled by the World Bank. These include the high-frequency, quarterly data for high-income joint World Bank-IMF Quarterly External Debt Statistics (QEDS) and the Public Sector Debt

Presentation and access to data have been refined to improve the user experience. This print version of *International Debt Statistics* now provides a summary overview and a select set of indicators, while an expanded dataset is available online (datatopics.worldbank.org/debt/ids).

The tables presented in *International Debt Statistics 2015* cover external debt stocks and flows, major economic aggregates, key debt ratios, and the currency composition of long-term debt. The text also includes such information as country notes, definitions, and data sources for each table. An expanded version of the tables is available online; it features longer time series and more detailed data for more than 100 time series indicators, as well as pipeline data for scheduled debt service payments on existing commitments to 2021.

International Debt Statistics 2015 is unique in its coverage of the important trends and issues fundamental to the financing of the developing world. This report is an indispensible resource for governments, economists, investors, financial consultants, academics, bankers, and the entire development community. World Bank open databases are available through the World Bank's website, www.worldbank.org. For more information on World Bank publications, go to publications.worldbank.org/ecommerce.
